

VenueLock

Every Seat, Accounted For

App Description

Cap attendance at an exact seat count — book a seat, get a QR pass, scan in.

1 At a Glance

- **App name:** VenueLock
- **Category:** Events / Productivity
- **Platforms:** Android, iOS, Web, Windows (Flutter)
- **Application ID:** APP_139127 (BDApps)
- **Tagline:** Lock the headcount. Unlock smooth entry.

2 Short Description

VenueLock lets event organizers cap attendance at an exact seat count. Attendees book a specific seat and get a QR entry pass; admins and volunteers scan people in live at the door with the phone camera — no overbooking, no clipboard.

3 Full Description

VenueLock is a seat-exact event check-in system for organizers who need to know — for certain — that a venue never gets oversold.

3.1 How it works

1. An admin creates a venue, lays out its seat map, and shares the venue's six-character join code with attendees.
2. Attendees open VenueLock, enter the join code, and pick an exact open seat from a live seat map. Booking a seat that is already taken is impossible — capacity is enforced on the server, not just in the interface.
3. Every booking generates a QR entry pass, saved on the attendee's device so it survives a force-close or restart — no reprinting, no "I lost my ticket."
4. At the door, admins or approved volunteers scan each pass with the phone's own camera for instant, live check-in.

3.2 Built for three roles

- **Admin** — create and configure venues, reserve seats for VIPs or staff before doors open, review and approve volunteer applications, and scan at the door.
- **Audience** — join with a venue code, book a seat, and carry the entry pass on-device.
- **Volunteer** — apply to a specific venue with its access code, get approved by the admin, and scan passes with a device-scoped token — no shared admin logins floating around at the gate.

3.3 Why organizers use it

- **No overbooking:** seat capacity is enforced server-side, not by trust.
- **No paper:** QR passes live on the attendee's phone.
- **No bottleneck at the door:** multiple volunteers can scan in parallel, each with their own scoped access.
- **No spreadsheet reconciliation:** seat status updates live across every device at the venue.

5 Feature Summary

- Multi-section seat maps (rows $\times$ columns per section) with a fixed, server-enforced capacity.
- Six-character venue access codes for both attendees and volunteers.
- Live seat availability, booking progress, and check-in counts.
- QR entry passes generated per booking and stored on-device, with share and save options.
- Camera-based QR check-in with a manual check-in fallback.
- Guest seat reservation and release from the admin seat map.
- Per-venue, per-device volunteer approval.
- Saved profile that prefills booking and volunteer forms.

6 Technology

- **App:** Flutter — `provider` for state, `go_router` for navigation, `mobile_scanner` for camera QR scanning, `qr_flutter` for pass generation, and `SharedPreferences` for on-device persistence of the profile, saved passes, and volunteer session.
- **Backend:** plain PHP with SQLite, exposed as a small REST API. Session-token auth for admins and per-device tokens for volunteers; OTP delivery runs through the BDApps carrier SMS/USSD SDK.
- **Landing page:** static HTML/CSS/JS, published alongside the Flutter web build.

7 Keywords

seat booking, event check-in, QR ticket, attendance tracking, venue management, event organizer, volunteer check-in, seat map, entry pass, capacity control
